Purpose

To enable registration of the users into the SAVE community, with the configuration – (re-)allocation & profiling of their access and manipulation rights. This sign-up is role-driven: the capabilities are growing from the end-user to the volunteer, to the family member, to professional caregiver and even to the IT specialist.

Real case

A senior member of the community, now in his 70-ies, has a daughter that wants to enroll as his SAVE caregiver. She is going through the menus of the smartphone client app, carefully browsing, at the beginning, her father's options. Then, she steps up in the volunteer / caregiver menus, completing her profile data. As she happens to be an IT professional, she can have a look (without being granted access) at the upper – administration – level.

How to use the SAVE service

A “concentric” approach of the user interfaces (UI/UX) allows all kinds of stakeholders to act in an unified way, being able even to pass from a level to the other (e.g. a physician becoming less involved, could keep the monitoring rights of a caregiver). This would enable a simple re-configuration of the degrees of freedom, as the unique set of features and manipulations is only blocked-unblocked by the system administrator by masking the complete (and scalable, future-proof) capabilities system.
